# Making A Report in Ask Phase Procedure

## 1.Business Statement:

This is 2-4 sentences that state the problem, the goal, and how it'll be used. Formula: **[What you're analysing] + [why] + [what decision it feeds into].**

**Example for your case:**

> "The Cyclistic marketing team wants to convert casual riders into annual members, since members are more profitable. To support this, I analyzed 12 months of historical trip data to understand how annual members and casual riders use Cyclistic bikes differently. These insights will inform a new marketing campaign aimed at casual riders, pending executive approval."

## 2.Description of Data Sources:

State: where the data came from, the time range, what's in it, and its limitations.

**Template:**

> "This analysis uses Cyclistic's historical trip data for [month/year] through [month/year] (12 months), provided by Motivate International Inc. under Divvy's data license. The data is organized as 12 monthly CSV files, each containing individual ride records with fields including ride ID, bike type, start/end timestamps, start/end station, and rider type (member or casual). The data is first-party and comprehensive, but does not include personally identifiable information, so it can't be used to determine whether the same casual rider purchased multiple single-ride passes."

## 3.Documentation of Cleaning/Manipulation

This is a **log**, not prose — write it as a numbered list as you go, so you don't forget steps. Keep it factual: what you did, why, and the before/after row count if relevant.

Example structure:

- Combined 12 monthly CSVs into one working file/table.
- Added ride_length column (ended_at − started_at).
- Added day_of_week column (WEEKDAY formula, 1=Sunday–7=Saturday).

- Removed rows with negative or zero ride_length (likely maintenance rides) — removed X rows.
- Removed rows with blank station names — removed X rows.
- Checked member_casual and rideable_type for inconsistent spelling/casing across months — standardized where needed.

## 4.Summary of Analysis:

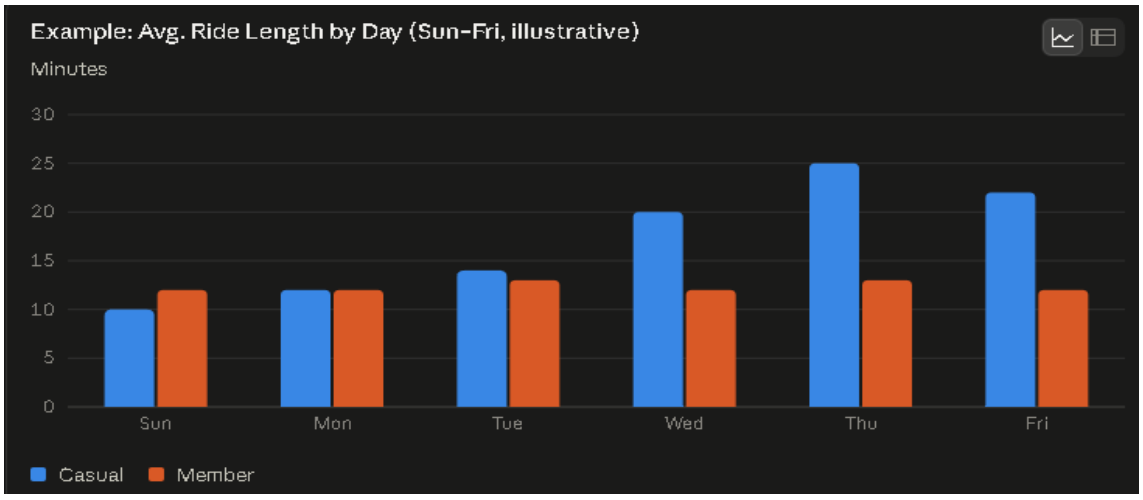

This is where you write in plain English what the pivot tables showed. Don't just restate numbers — say what they mean.

**Example (fill in real numbers once you have them):**

> "On average, casual riders' trips last about [X] minutes, compared to [Y] minutes for members — roughly [Z]% longer. This suggests casual riders use Cyclistic more for leisure, while members' shorter, more frequent trips are consistent with commuting. Ride volume also differs sharply by day: casual ridership peaks on weekends, while members ride most consistently Monday through Friday, reinforcing that members primarily commute and casual riders primarily ride recreationally."

## 5.Visualization + Key Findings

Pick 3-4 charts max — quality over quantity. Given your data, the highest-value ones are usually:

## 6.Top 3 Recommendations:

Each recommendation should tie directly back to a specific finding — no generic marketing advice.

**Template:** "Because [finding], Cyclistic should [action]."

Examples (adapt to your actual findings):

1. Because casual ridership peaks on weekends, launch a weekend-focused membership promotion (e.g., discounted trial memberships) targeting weekend riders at high-traffic stations.

2. Because casual riders take much longer rides, introduce a membership tier or perk that rewards longer/leisure rides, so members don't feel like membership is only for short commutes.

3. Because casual ridership spikes seasonally (e.g., summer), run a targeted digital campaign in the weeks leading into peak season, when casual usage — and conversion potential — is highest.
